Sixth International Conference FMNS-2015 10-14.06.2015, Blagoevgrad, BULGARIA

Mini-conference "Inquiry-Based Approach in Higher Education in Mathematics and Informatics"

Test system and software for evaluation the students knowledge in programming

Nikolay Kirov

Computer Science Department, New Bulgarian University, Sofia, Bulgaria nkirov@nbu.bg

Introduction

- Best practice, better practice, good practice, no so bad practice, ...
- A test system for evaluation the students knowledge in programming.
- The test system as a part of the learning process of programming.
- The test system as a Inquiry-Based Approach in Higher Education in Informatics.
- For students: preparing for the test, test, verifying the results.
- For teachers: preparing the test, checking the test, analyzing the results.

Terminology

- The test consists of **items**.
- The **stem** is the introductory question or statement at the beginning of each item.
- The stem is followed by the **options**.
- The options are:
 - answers the correct options, and
 - distractors the incorrect options.
- The items are stored in an **item bank**.
- Individual test consists of fixed number of items with fixed number of options.

Special multiple choice test

- The individual tests are generated from the test bank randomly.
- The number of options in any individual test is fixed on 4 for all items.
- In any individual test the number of correct options (answers) of an item may be **any number** in the interval [0,4];
- The student have to identify each answer and each distractor. For any option he/she has 3 choices of response:
 - yes, i.e. I know the option is an answer;
 - no, i.e. I know the option is a distractor;
 - nothing, i.e. I do not know whether the option is an answer or a distractor.
- Any correct response (yes or no) adds one point in the total score but any incorrect (oposite) response subtracts one point (a penalty point) from the total score.

Special multiple choice test

• We estimate an individual test of M items with x points total score as follows:

- To calculate the probability of **passing** the test using random method, we choose a test with M = 10 items (maximum 40 points total score).
- Probability is 0.11% in case the student has noted all the options yes or no.
- Probability is 0.0034% in case the student marked options randomly with yes, no or nothing.

Test system and software for evaluation the students knowledge in programming 4/18

Special multiple choice test – procedure

Before the test time:

- At least one week before the date of the test all original stems and two example options per item (an answer and a distractor) are published online on the course website [w].
- A workshop with students is conducted a few days before the test to discuss the published issues of the test.

During the completion of the test [p]:

- The students can use lectures, textbooks and any other printed materials.
- The students are allowed to use computer as a book, or also compiler, or even Internet.
- Anyone can ask a question about ambiguities in the test.

Special multiple choice test – procedure

After the verification of the tests [p]:

- The individual tests are returned to the students.
- Each student should carefully check his/her individual test in order to determine whether he/she agrees with the noted errors.
- If something is not clear she/he can discuss the case.
- It is normal to increase the total score of the student if his/her arguments about the case are reasonable.

Why this type of test system is suitable for students in programming?

According to a definition by Linn, Davis and Bell, **inquiry** is the intentional process of diagnosing problems, critiquing experiments, distinguishing alternatives, planning investigations, researching conjectures, searching for information, constructing models, debating with peers, and forming coherent arguments.

inquiry		В	D	Α
diagnosing problems	understanding the item	+	+	+
critiquing experiments	using compiler	+	+	-
distinguishing alternatives	comparing options	-	+	+
planning investigations	How to search?	+	+	-
researching conjectures	yes, no, nothing	+	+	-
searching for information		+	+	+
constructing models	programming	+	-	_
debating with peers		+	-	+
forming coherent arguments		-	-	+

Test generator - github.com/nkirov/tests_generator

- Preparation of the test begins with selecting items stems and options and put them into **item bank** [f].
- At least 10 items each having at least 5-6 possible answers should be completed and stored as a text file in a particular format. This file is the input to tests_generator.
- tests_generator generates **individual tests** using random distribution of both items and their options [p].
- Each individual test consists of 10-20 items with 4 options (a, b, c, d).
- The output plain text file (out.tex) (in LATEX format) contains all individual tests [f].
- The second output file (tab.tex) is a table for checking the tests [f].
- The third file (data.tex) is a copy of the input file with additional data for the generated individual tests [f].

Test system and software for evaluation the students knowledge in programming 8/18

Test generator - github.com/nkirov/tests_generator

● ○ ○	Test generator, v.1.2, 8.06.2015			
Input file name:	t3_data.tex			
Title:	NETB151 Object-Oriented Programming (C++) +			
Test No	Test 3	\$		
Date:	8.06.2015	•		
Number of test questions:	15	•		
Number of tests:	50	¢		
	GO			

Test checker - github.com/nkirov/tests_checker

Checking test can be carried out:

- manually using the table (tab.tex) generated by tests_generator [p] or
- automatically by tests_checker.

Uploading data on the students' answers can be done:

- manually using the user interface of tests_checker or
- automatically using a special template for students' answers and scanner [p].

The program creates a text file (save.txt), containing audited tests [f].

Test checker - github.com/nkirov/tests_checker

000	Test che	cker, v.1.2	, 8.06.2015			
Test	7764	÷ 1	() V

b)	ь О 0	() yes	💿 no	+		
c)	c 0	💽 yes	⊖ no] -		
d)	d 0	⊖ yes	💿 no	+		
Total	1	Q	uest 1			
Exam	20	Point	ts 1			
Load Save Calculate						

Test checker - github.com/nkirov/tests_checker

After entering the students' answers, test_checker gives the results – for each option of each item in the test bank calculates two sets of numbers (file data_result.txt) [f]. The set $A = \{a, a_1, a_2, a_3\}$ represents all the tests and the set $B = \{b, b_1, b_2, b_3\}$ represents the individual tests of students, which pass the test (e > 2).

- a, b the number of individual tests which contain the corresponding item and four of its options;
- a_1 , b_1 the number of tests without response;
- a_2 , b_2 the number of tests with correct response;
- a_3 . b_3 the number of tests with incorrect (opposite) response.

 $a_1 + a_2 + a_3 = a$, $b_1 + b_2 + b_3 = b$, $b \le a$ and $b_i \le a_i$ for i = 1, 2, 3.

The output files of test_checker are data_result.txt and data_result1.txt, the format of the second file is suitable for input in spreadsheet. Test system and software for evaluation the students knowledge in programming 12/18

First test of Object-oriented programming (second semester), NBU, program "Network Technologies"

- Test bank consists of 12 item.
- The numbers of options are: (14,16,19,16,12,7,12,16,10,9,16,22).
- Any individual test consists of 11 items (maximum 44 points).
- We have 19 individual tests.

Items for 19 individual tests - X items, Y results.

- Incorrect the number of tests with the incorrect (opposite) response.
- Correct the number of tests with the correct response.
- No the number of tests without response.

Items for 11 individual tests, which are collected at least a half (22) of maximum points (44).

- Incorrect the number of tests with the incorect (opposite) response.
- Correct the number of tests with the correct response.
- No the number of tests without response.

Options for 19 tests: X - options, Y - results.

Conclusion

The software is written in C++ using Qt – cross-platform application and UI development framework (qt.digia.com/). It is publicly available and **open source**:

- github.com/nkirov/tests_generator
- github.com/nkirov/tests_checker
- The software tools save a lot of time and efforts of the teacher for the preparation and verification the test and evaluation the test results.
- The idea of such a test system arose in 1998, when I started teaching programming in Pascal for students from South-West University "Neofit Rilski" nikolay.kirov.be/swu/i2_bg.html Then I wrote the first version of tests_generator (in Pascal).
