

# Graphs

# Outline and Reading

## ◆ Graphs (§12.1)

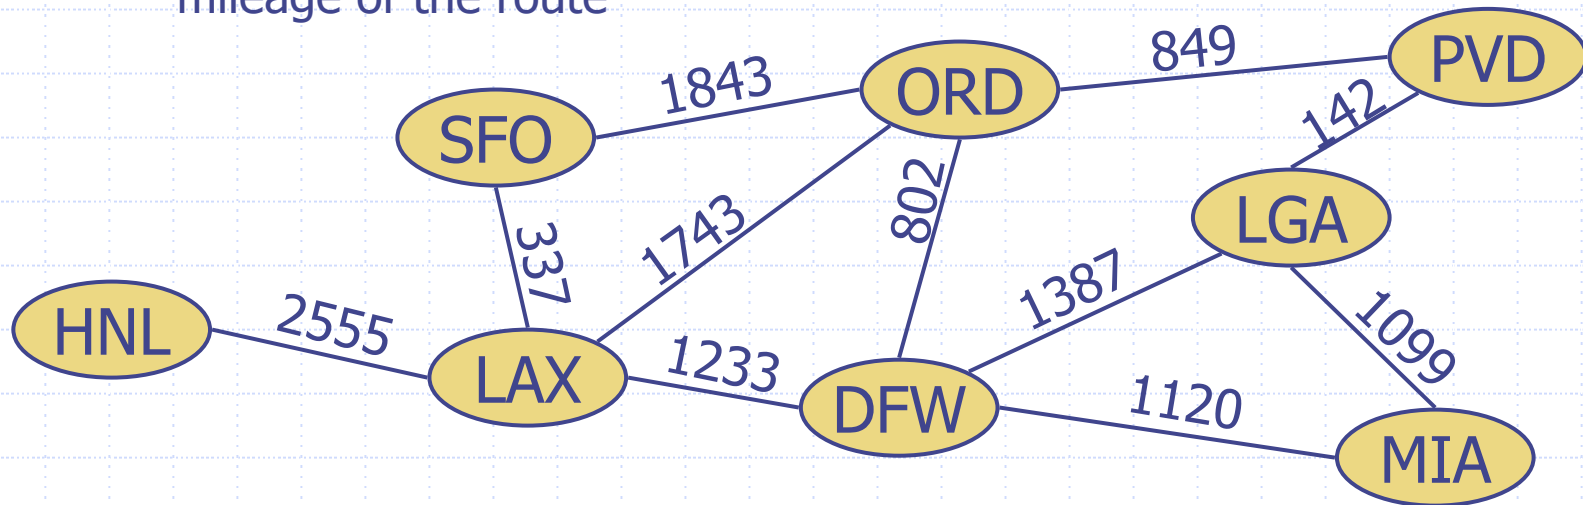

- Definition
- Applications
- Terminology
- Properties
- ADT

## ◆ Data structures for graphs (§12.2)

- Edge list structure
- Adjacency list structure
- Adjacency matrix structure

# Graph

- ◆ A graph is a pair  $(V, E)$ , where
  - $V$  is a set of nodes, called **vertices**
  - $E$  is a collection of pairs of vertices, called **edges**
  - Vertices and edges are positions and store elements
- ◆ Example:
  - A vertex represents an airport and stores the three-letter airport code
  - An edge represents a flight route between two airports and stores the mileage of the route

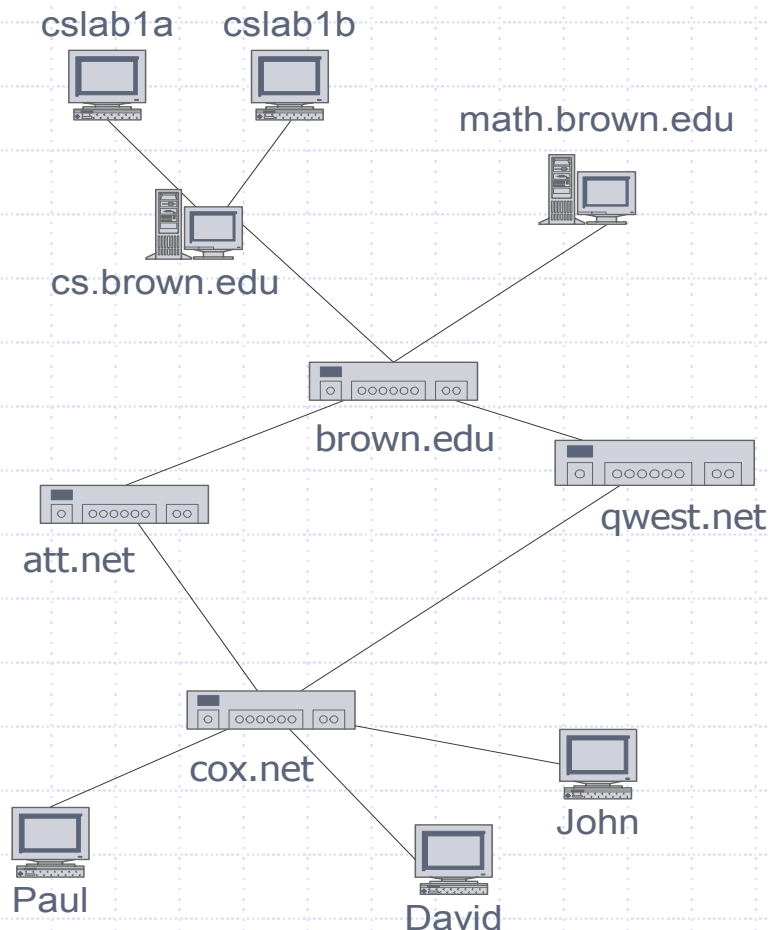

# Edge Types

- ◆ Directed edge
  - ordered pair of vertices  $(u,v)$
  - first vertex  $u$  is the origin
  - second vertex  $v$  is the destination
  - e.g., a flight
- ◆ Undirected edge
  - unordered pair of vertices  $(u,v)$
  - e.g., a flight route
- ◆ Directed graph
  - all the edges are directed
  - e.g., route network
- ◆ Undirected graph
  - all the edges are undirected
  - e.g., flight network

# Applications

- ◆ Electronic circuits
  - Printed circuit board
  - Integrated circuit
- ◆ Transportation networks
  - Highway network
  - Flight network
- ◆ Computer networks
  - Local area network
  - Internet
  - Web
- ◆ Databases
  - Entity-relationship diagram

# Terminology

- ◆ End vertices (or endpoints) of an edge
  - U and V are the *endpoints* of a
- ◆ Edges incident on a vertex
  - a, d, and b are *incident* on V
- ◆ Adjacent vertices
  - U and V are *adjacent*
- ◆ Degree of a vertex
  - X has *degree* 5
- ◆ Parallel edges
  - h and i are *parallel edges*
- ◆ Self-loop
  - j is a *self-loop*

# Terminology (cont.)

## ◆ Path

- sequence of alternating vertices and edges
- begins with a vertex
- ends with a vertex
- each edge is preceded and followed by its endpoints

## ◆ Simple path

- path such that all its vertices and edges are distinct

## ◆ Examples

- $P_1=(V,b,X,h,Z)$  is a simple path
- $P_2=(U,c,W,e,X,g,Y,f,W,d,V)$  is a path that is not simple

# Terminology (cont.)

- ◆ Cycle
  - circular sequence of alternating vertices and edges
  - each edge is preceded and followed by its endpoints
- ◆ Simple cycle
  - cycle such that all its vertices and edges are distinct
- ◆ Examples
  - $C_1 = (V, b, X, g, Y, f, W, c, U, a, \rightarrow)$  is a simple cycle
  - $C_2 = (U, c, W, e, X, g, Y, f, W, d, V, a, \rightarrow)$  is a cycle that is not simple

# Properties

## Property 1

$$\sum_v \deg(v) = 2m$$

Proof: each edge is counted twice

## Property 2

In an undirected graph with no self-loops and no multiple edges

$$m \leq n(n-1)/2$$

Proof: each vertex has degree at most  $(n-1)$

What is the bound for a directed graph?

## Notation

$n$	number of vertices
$m$	number of edges
$\deg(v)$	degree of vertex $v$

## Example

- $n = 4$
- $m = 6$
- $\deg(v) = 3$

# Main Methods of the Graph ADT

## ◆ Vertices and edges

- are positions
- store elements

## ◆ Accessor methods

- `aVertex()`
- `incidentEdges(v)`
- `endVertices(e)`
- `isDirected(e)`
- `origin(e)`
- `destination(e)`
- `opposite(v, e)`
- `areAdjacent(v, w)`

## ◆ Update methods

- `insertVertex(o)`
- `insertEdge(v, w, o)`
- `insertDirectedEdge(v, w, o)`
- `removeVertex(v)`
- `removeEdge(e)`

## ◆ Generic methods

- `numVertices()`
- `numEdges()`
- `vertices()`
- `edges()`

# Edge List Structure

- ◆ Vertex object
  - element
  - reference to position in vertex sequence
- ◆ Edge object
  - element
  - origin vertex object
  - destination vertex object
  - reference to position in edge sequence
- ◆ Vertex sequence
  - sequence of vertex objects
- ◆ Edge sequence
  - sequence of edge objects

# Adjacency List Structure

- ◆ Edge list structure
- ◆ Incidence sequence for each vertex
  - sequence of references to edge objects of incident edges
- ◆ Augmented edge objects
  - references to associated positions in incidence sequences of end vertices

# Adjacency Matrix Structure

- ◆ Edge list structure
- ◆ Augmented vertex objects
  - Integer key (index) associated with vertex
- ◆ 2D-array adjacency array
  - Reference to edge object for adjacent vertices
  - Null for non adjacent vertices
- ◆ The “old fashioned” version just has 0 for no edge and 1 for edge

# Asymptotic Performance

<ul style="list-style-type: none"> <li>◆ <math>n</math> vertices, <math>m</math> edges</li> <li>◆ no parallel edges</li> <li>◆ no self-loops</li> <li>◆ Bounds are "big-Oh"</li> </ul>	Edge List	Adjacency List	Adjacency Matrix
Space	$n + m$	$n + m$	$n^2$
